

# Implicit List: Freeing a Block

## ■ Simplest implementation:

- Need only clear the “allocated” flag

```
void free_block(ptr p) { *p = *p & -2 }
```

- But can lead to “false fragmentation”

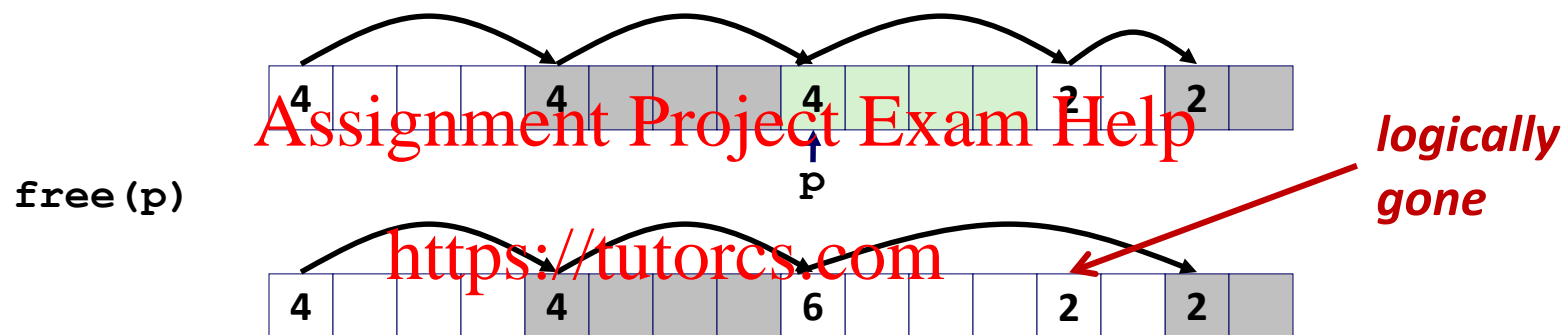

`malloc(5)` ***Oops!***

*There is enough free space, but the allocator won't be able to find it*

# Implicit List: Coalescing

- Join (*coalesce*) with next/previous blocks, if they are free
  - Coalescing with next block

WeChat: cstutorcs

```
void free_block(ptr p) {
    *p = *p & -2;           // clear allocated flag
    next = p + *p;          // find next block
    if ((*next & 1) == 0)
        *p = *p + *next;    // add to this block if
    }                       // not allocated
```

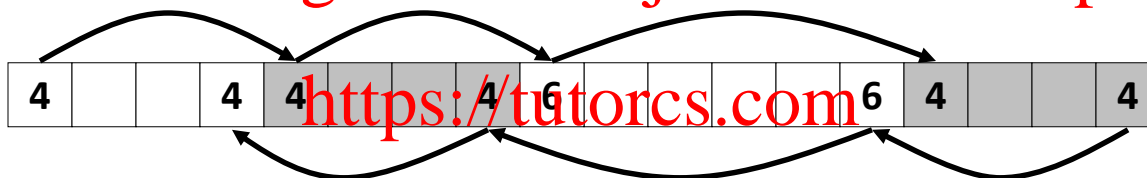

- But how do we coalesce with *previous* block?

# Implicit List: Bidirectional Coalescing

## ■ **Boundary tags** [Knuth73]

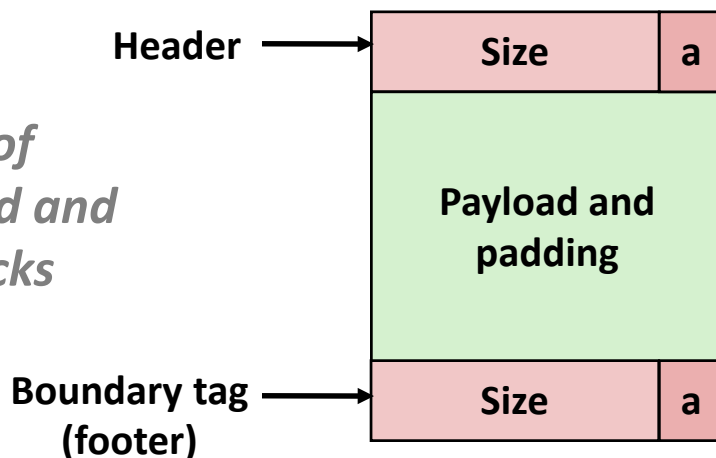

- Replicate size/allocated word at “bottom” (end) of free blocks
- Allows us to traverse the “list” backwards, but requires extra space
- Important and general technique!

*Format of  
allocated and  
free blocks*

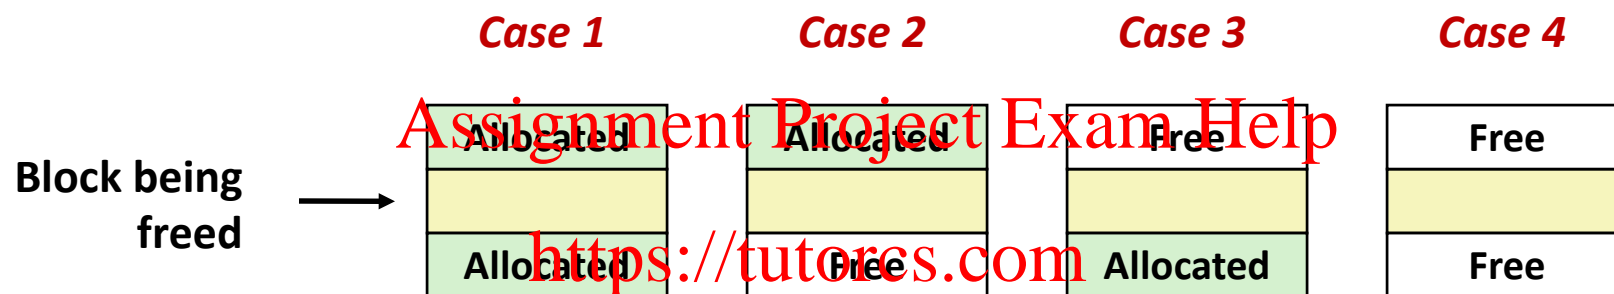

a = 1: Allocated block  
a = 0: Free block

Size: Total block size

Payload: Application data  
(allocated blocks only)
