Dynamic Memory Allocation

Programmers use dynamic memory allocators (such as malloc) to Acquiginen VIVI t Project Exam at run time.

Application Dynamic Memory Allocator

 For data structures whose size is only known at runtime.

Dynamic memory allocators manage an area of process virtual memory known as the heap.

User stack eChat: cstutorcs Heap (via malloc) Uninitialized data (.bss) Initialized data (.data) Program text (.text)

Top of heap (brk ptr)

Dynamic Memory Allocation

- Allocator maintains heap as collection of variable sized blocks, which are either allocated or free
- Types of allocationsment Project Exam Help
 - Explicit allocator: application allocates and frees space
 - E.g., mallocand free in C s.com
 - Implicit allocator, application allocates, but does not free space
 - E.g. garbage collection in Python, Java, ML, and Lisp
- Will discuss simple explicit memory allocation today

The malloc Package

```
#include <stdlib.h>
void *malloc(size t size)
```

- Successful:
 - Returns a pointer to a memory block of at least size bytes (typically) signment Pytoject Exam Help
- If size == 0, returns NULL https://tutorcs.com
 Unsuccessful: returns NULL (0) and sets errno

void free(void *WeChat: cstutorcs

- Returns the block pointed at by **p** to pool of available memory
- p must come from a previous call to malloc or realloc

Other functions

- **calloc:** Version of **malloc** that initializes allocated block to zero.
- **realloc:** Changes the size of a previously allocated block.
- **sbrk:** Used internally by allocators to grow or shrink the heap

malloc Example

```
void foo(int n, int m) {
    int i, *p;
    /* Allocate a block of n ints */
    p = (int *) malloc(n * sizeof(int));
    if (p == NASSignment Project Exam Help
        perror("malloc");
        exit(0);
                    https://tutorcs.com
    /* Initialize allocated block */
for (i=0; i<n; */*Chat: CStutorcs
        p[i] = i;
    /* Return p to the heap */
    free(p);
```
